

QUICK SLIT SEEDER

The QUICK-SLIT SEEDER can follow the ground contours accurately and plant seeds at a constant depth in its own prepared mini seedbed (FIGURES 1 and 2). Seeds planted at 12mm ($\frac{1}{2}$ - $\frac{3}{4}$ inch) give an excellent rooting structure, which holds the grass sward together better than shallow planted seeds which tend to be moved easily or scuffed off. To obtain a hard wearing playing surface, the Quick-Slit Seeder should be used at regular intervals. The combination of the angled slitter discs (FIGURE 3), and special seed tubes lifting and placing seed into the soil directly, also move the turf in a wave like motion. The Quick-Slit Seeder is a cultural tool in that it acts as a grass root pruner by cutting or breaking the grass plant roots. For the survival of the grass plant, it must immediately put all of it's resources into growing new roots, resulting in stronger plants with better root structures. This practice helps to develop and strengthen the root structures, thus giving a much improved playing surface by relieving surface compaction and aerating the soil, which stimulates root growth and encourages the existing native grasses to grow between rows.
